

# USB-ASIO V2.0 driver's guide (Win)

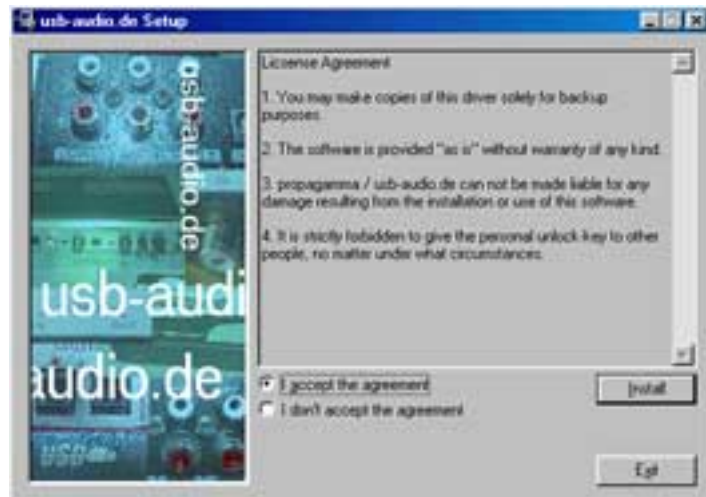

<http://www.usb-audio.com>

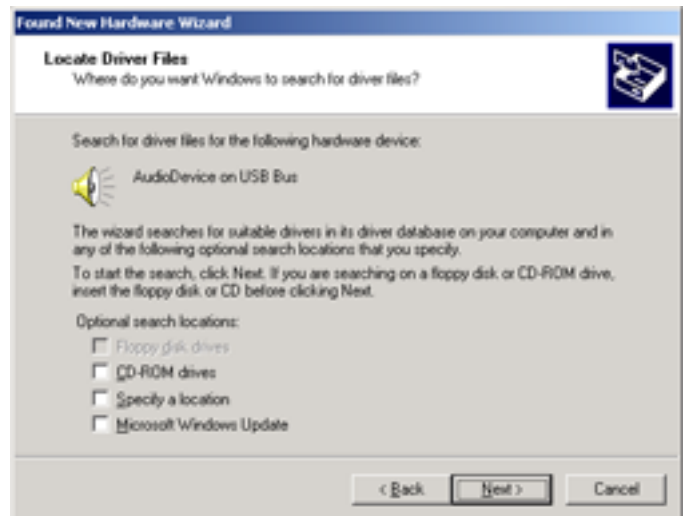

## 1. Installation

For unzipping you need WinZip: e.g. <http://www.winzip.com>

1. Unzip "usb\_asio.zip".
2. Copy all the unzipped files to a folder at your harddisk. Name it whatever you like.  
Do not move or delete any of these files, not even after the installation.
3. Run "setup.exe"
4. Agree to our terms of license. :-)
5. If there's already a driver for your USB Audio device installed, you will be prompted for uninstallation of the earlier ones. It should be safe to let "setup.exe" do the job.
6. After completion of the setup reboot the computer.

7. Win 98/SE/ME/2000: on the next start you might be asked to insert your Windows® CD and you might have to follow the "Found New Hardware Wizard". See Step 10 for Win XP.
8. In order to complete the installation reboot again.

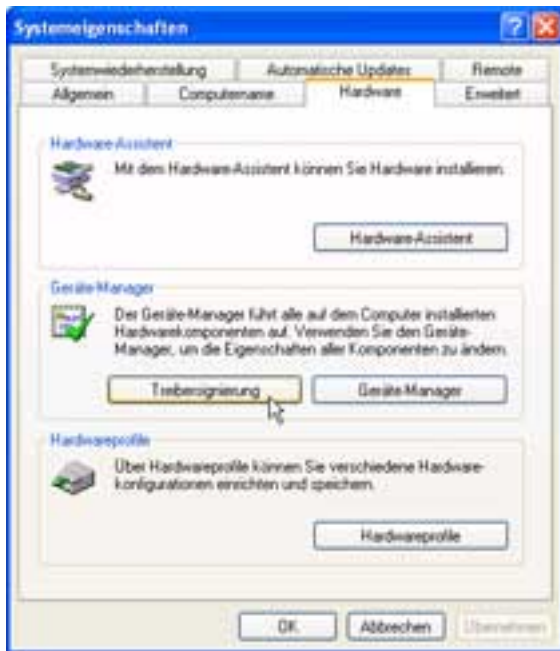

9. On Windows 2000 (and XP) ® there might be a "Digital Signature Not Found" message. You can safely ignore it and click "Yes".

10. After running "setup.exe" and rebooting on Win XP ® unfortunately the native USB audio driver is installed again automatically while the interface is plugged. We're currently working on an installer that workarounds this. Meanwhile installation is a little bit tricky on Windows XP:

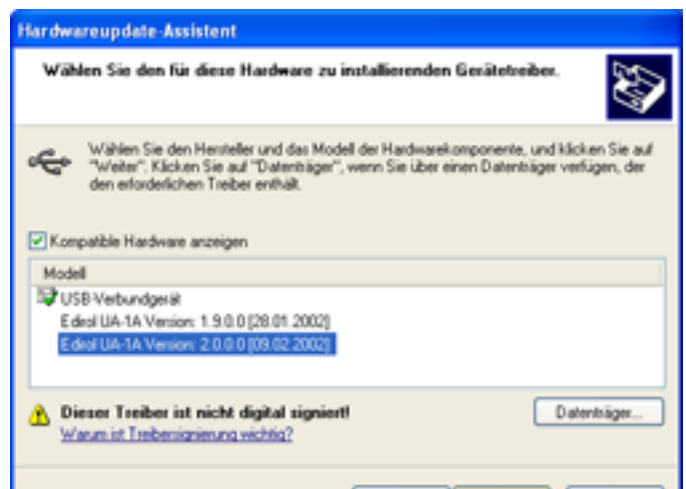

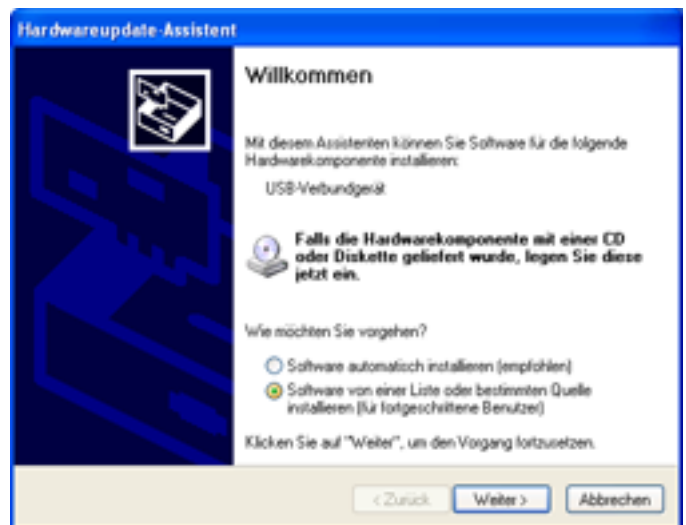

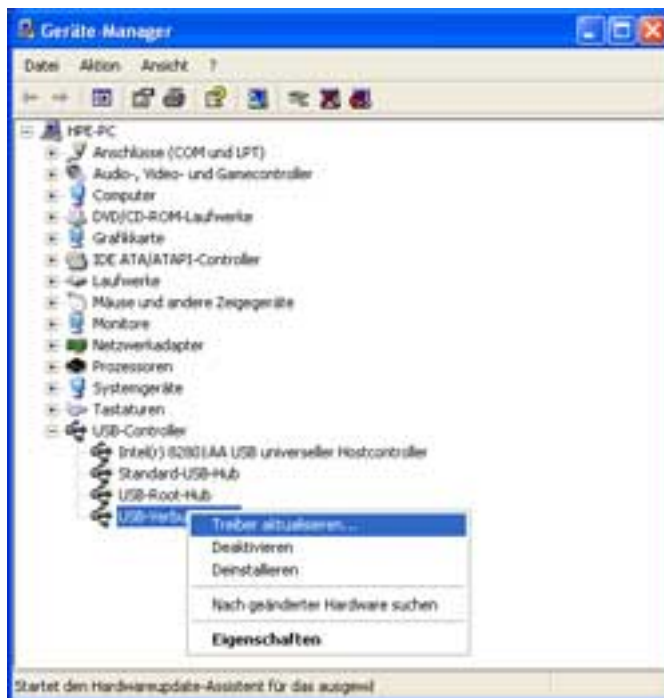

As a first step open the system control panel and select "driver signature" from the menu.

11. Select "Ignore" for driver signature options.  
(You can switch it back at any time after the installation.)

12. Make sure that the USB audio device is connected.

13. After this click on the "device manager". Update the driver for the USB audio box (usually it's a composite device) and chose "list".

14. Two drivers will be installed now: The USB part of the USB ASIO driver and support for the MME connection.
15. On completion it's ready for use - have fun and do some good music with it!

## 2. Choose bit-depth and sample resolution

Enter the control panel via the button in your application's ASIO settings.

The devices pane allows to select the bitrate used for the USB connection. Some devices only support 16bit.

"Recording resolution" is the bitrate used for the ASIO connection.

If it's different from the first one sound quality can be increased by adding "dither". (Dither is noise added to the bits that have to be cut off. So the noise isn't audible but changes the "arithmetical carry" on rounding the last bit to be used.)

"System performance" changes buffersizes and latencies. Higher values allow the use of more plugins, effects etc. at the same time but aren't fun playing virtual instruments live.

Some functions are for future use and disabled - don't worry about that.

## 3. Get updates

New versions will be available from the USB audio interface manufacturer's website. There should also be a link to get help on support issues.

## 4. Uninstall

Uninstallment works (like with any other Windows® software) via the system control panel. After the driver's are removed you're prompted to restart your computer.

On the next start the driver installation procedure starts again like if you plugged your device for the first time.
